Software Development Skills Front-End, Online course

Oskari Antintupa, 003368066

LEARNING DIARY

LEARNING DIARY

20.07.2026

Activity: Started the Front-End project by following the SaaS Landing Page tutorial. Set up the development environment in Visual Studio Code and explored the project structure, including HTML, CSS and JavaScript files.

Learning outcome: I learned how HTML, CSS and JavaScript work together in a larger project instead of being separate files. Exploring the project structure also helped me understand how different parts of a website are connected.

21.07.2026

Activity: Worked on the navigation menu and overall page layout. Followed the tutorial to understand how Flexbox was used to position navigation items and organize content on the page.

Learning outcome: I improved my understanding of Flexbox and learned how it can be used to create responsive layouts. I also learned how containers, spacing and alignment affect the structure of a web page.

22.07.2026

Activity: Decided to modify the original SaaS Landing Page into a Developer Portfolio. Changed the website title, logo, navigation links and hero section content to better match the new purpose of the website.

Learning outcome: I learned how an existing project can be customized into a completely different type of website. This helped me understand how reusable page structures can be adapted to different use cases.

23.07.2026

Activity: Added About, Projects, Skills and Contact sections to the portfolio. Connected the navigation menu to the different sections using internal links and section IDs.

Learning outcome: I learned how single-page websites use anchor links and section identifiers for navigation. I also gained experience structuring content into logical sections.

24.07.2026

Activity: Created a Projects section to showcase previous coursework. Added project cards describing a database project, a Rust programming project and the Front-End portfolio project.

Learning outcome: I learned how CSS Grid can be used to organize content into responsive card layouts. I also practiced presenting project information in a clear and structured way.

24.07.2026

Activity: Created a Skills section and added Font Awesome icons for HTML, CSS, JavaScript, SQL, Rust and Git. Improved the visual design of the section and adjusted spacing and styling.

Learning outcome: I learned how external icon libraries can be integrated into a web project. I also gained more experience with CSS styling and user interface design.

25.07.2026

Activity: Replaced the original images from the tutorial with images that better suited the portfolio theme. Created and added a custom favicon and updated the visual appearance of the website.

Learning outcome: I learned how website branding can be customized through images, icons and visual design choices. I also learned how favicons are added and displayed in web browsers.

26.07.2026

Activity: Focused on responsive design and mobile optimization. Tested the website using Firefox Responsive Design Mode and adjusted the hero section, images and layouts for smaller screen sizes.

Learning outcome: I learned how media queries can be used to create different layouts for desktop and mobile devices. I also learned how image size and positioning affect the user experience on mobile screens.

27.07.2026

Activity: Completed the final testing and reviewed all project sections. Removed unnecessary code from the original template and made final improvements to the layout and styling.

Learning outcome: This project helped me improve my HTML and CSS skills and gave me practical experience with Flexbox, CSS Grid, responsive design and Font Awesome. I learned how to transform a tutorial project into my own portfolio website and how to optimize it for both desktop and mobile devices. The most challenging part was adapting the hero section and images for mobile screens, but solving these issues improved my understanding of responsive web development.
